NUWATT

Must-Have Improvements (High Priority – Direct Impact on Conversions)

Breadcrumbs · #116 · AC task 476201

https://www.nuwattlighting.com/collections/ufo-led-lights?preview_theme_id=148630929482

Test method: iPhone 14 profile in WebKit (Safari's engine) and Pixel 7 profile in Chromium, with touch input, mobile user agent and 3× pixel density, against preview theme *Figma Match – 2026-09-04* (ID 148630929482). Breadcrumbs also measured at 360px and 375px. These are device emulations, not physical handsets: items marked ◆ should get a quick confirmation on a real iPhone and Android phone before sign-off.

☑ ① Current Page Disappears, Leaving a Trailing Slash (Critical)

⚠ Issues:

- Client-reported, reproduced and explained. The preview theme still has `.breadcrumbs__item[aria-current=page]{max-width:60%; min-width:0; overflow:hidden; text-overflow:ellipsis}` inside a row that also has `overflow-x:auto`.
- The current crumb shrinks first, down to **0px**, so the row ends “Highbays /”. WebKit even reports the label as empty text. Scrolling sideways reveals nothing.
- Measured across 18 collections, **none showed its full current-page name at any width**:

Screen width	3-level paths: current page invisible	2-level paths: label truncated
360px (common Android)	**14 of 14**	3 of 3 (33–51% shown)
375px (iPhone SE / 13 mini)	**14 of 14**	4 of 4 (41–66% shown)
390px (iPhone 14)	**11 of 14**	4 of 4 (47–78% shown)
412px (Pixel 7)	**9 of 14**	3 of 3 (54–82% shown)

✓ Recommendations:

- Port Option C (reported live on the published theme on Oct 5) into preview theme 148630929482: every crumb `flex-shrink:0`, no max-width or ellipsis; the row scrolls, is set to `scrollLeft = scrollWidth` on load, and gets a 28px fade on the left edge when scrolled.
- The concept was injected into the preview pages: the full current-page label is visible on every path tested.

I believe you guys already implemented this, can you confirm?

☑ ② Governing Rule (Documented, as Requested) (High)

⚠ Issues:

- **Current behavior:** (1) earlier crumbs never shrink (`white-space:nowrap`); (2) the current crumb absorbs all the shortage, from its 60% cap down to zero; (3) the row only scrolls when the earlier crumbs alone are wider than the screen.
- Result: 2-level paths truncate with “…”, 3-level paths hide the current page and scroll. That is why some paths scroll and others truncate.

✓ Recommendations:

Agreed, always scroll on mobile, don't truncate

- **Proposed rule:** never truncate. If the trail fits, show it; if not, scroll horizontally, auto-scrolled to the end so the current page is always visible, with a fade marking hidden crumbs on the left.
- This also satisfies the client’s “at least three full characters” request, since nothing is cut.

☑ ③ Mobile Path Can Still Differ From Desktop (High)

⚠ Issues:

- **The original case is fixed:** Commercial Lighting → LED Panels now shows Home / Commercial Lighting / LED Panel Lights from the real mobile menu and on direct load.
- **Remaining gap:** mobile-drawer sub-links have no class or `data-nest-level`, so the click tracker records only the top-level tap and the page falls back to the deepest menu match.
- Collections under more than one parent show a path the user didn’t take, e.g. Bullet Lights → “Home / Residential Lighting / Landscape Lights / Bullet Lights” when tapped from Commercial Lighting; Canless Recessed Lighting picks up “Residential Lighting” when tapped from Recessed Lighting.
- Also affects Flood, Canopy, Highbays, Landscape, Retrofit, MR16 and Square collections. Desktop records the clicked path per the code (not click-tested).

✓ Recommendations:

- Add `data-nest-level` (or a parent attribute) to the Meteor mobile drawer links, or record the drawer’s open-level stack on tap, and include those links in the click-tracker selector.

If I understand correctly adding the data nest level to mobile provides the same function as the parent collection metafield does to desktop - it identifies parent collection, which is written to session storage and examined by the java script if the previous page was a parent page. Is that right? That seems to me like the better solution, but what do you guys think?

☑ ④ Product Page Breadcrumb (High)

⚠ Issues:

- It sits **below** the product title. With a collection trail it reads “Home / … / Canless Recessed Lighting / 4″…”: the product name is squeezed to 37px of 304px.
- The “…” expand button is an **18×16px** tap area.

✓ Recommendations:

Breadcrumbs for product pages should be above the title. Same place as on the collection pages. You guys made that change yesterday. Confirm that's the rule now?

- Move it above the title, apply the same no-truncation rule, and give “…” a 44×44px hit area.
- Alternative mobile pattern: a single “‹ Back to Canless Recessed Lighting” link.

☑ ⑤ Structured Data Doesn’t Match the Visible Breadcrumb (Medium)

⚠ Issues:

- The JSON-LD BreadcrumbList is rendered server-side from a different source. UFO page markup: Home › Industrial LED Lighting › LED High Bay Lights › UFO. Visible: Home / Commercial Lighting / Highbays / UFO LED High Bay Lights.
- The product page markup uses “Black Recessed Lighting”, which the visible trail never shows. Google expects markup to match what users see.

✓ Recommendations:

- Generate both from the same source: a server-side Liquid map of collection → parent, with JavaScript only overriding it for the clicked path.

This happens on desktop too. We have multiple collections nested under different parents. For example Landscape Lighting is under Outdoor and under Residential.
To avoid showing users the wrong breadcrumb trail, Jason decided to always show the user path taken, even when that path hops across unrelated categories. That is also why the structured data doesn't match 100%.
Open to hearing a better solution. We were talking before about providing you a canonical collection for every product, but that would simply take too long.

☑ ⑥ Breadcrumb Appears Late (Medium)

⚠ Issues:

- The trail is built in JavaScript after the Meteor menu app loads and fetches its JSON. “Home” shows alone for **1.2–2.4 s** on a fast connection, then the row expands; phones on cellular will be slower.

✓ Recommendations:

- Server-render the default trail from the same Liquid map; JavaScript enhances it.

Good catch, please proceed

Should-Have Improvements (Medium Priority – Builds Trust & UX Confidence)

Row Height: Crumb links are 29px tall; make the row at least 44px so each crumb is an easy tap.

Separator Contrast: The “/” separators are 35% opacity and hard to see outdoors; use ~55%.

Can you create a figma mockup showing your stylistic changes? Row height + separator contrast + font size. On that same figma note the above changes were made. So we can review as a team.

Duplicate of the H1: On collection pages the current crumb repeats the H1 directly below it. If Option C is rejected, REI’s approach (parents only, H1 as current page) avoids truncation entirely.

What option C?
Following the H1 would create an extremely long final step in the breadcrumb, that's why we decided to go with the page title. Open to hearing other solutions.

Font Size: Breadcrumbs are 16.8px Roboto, larger than the product title. Set them to ~14px in the shared type scale.

Anchor Pages: The new anchor page has no breadcrumb; consider Home / Residential Lighting / Bedroom Lights for consistency.

Home > Anchor page. They're top level destinations.
